23 March 2026

Available at: [leonardopacheco.xyz/slides/llal13.pdf](https://leonardopacheco.xyz/slides/llal13.pdf)

# MAIN RESULTS

Decidability for non-classical variations of

- ▶ GL
- ▶ modal  $\mu$ -calculus

using fully-labeled non-wellfounded proof systems.

# GL

- ▶  $\Box(\Box P \rightarrow P) \rightarrow \Box P$
- ▶ complete w.r.t. finite reverse well-founded models

# $\mu$ -CALCULUS

- ▶ add least/greatest (monotone) fixed-points to modal logic
- ▶ complete w.r.t. all finite Kripke models

# CONSTRUCTIVE MODAL LOGIC

- ▶ “Minimal” modal logic based on IPC.
- ▶ Models of the form  $\langle W, \preceq, R, V \rangle$ , where
  - ▶  $\preceq$  is the *intuitionistic* relation,
  - ▶  $R$  is the *modal* relation.
- ▶ Extend the valuation by:
  - ▶  $M, w \models \Box\varphi$  iff, for all  $v, u \in W$ , if  $w \preceq v$  and  $vRu$ , then  $M, u \models \varphi$ ;
  - ▶  $M, w \models \Diamond\varphi$  iff, for all  $v \in W$ , if  $w \preceq v$  there is  $u$  such that  $vRu$  and  $M, u \models \varphi$ .

# OTHER NON-CLASSICAL MODAL LOGICS

- ▶ Intuitionistic modal logics:
  - ▶  $(\Diamond P \rightarrow \Box Q) \rightarrow \Box(P \rightarrow Q)$  and  $\Diamond(P \vee Q) \rightarrow \Diamond P \vee \Diamond Q$ ,
  - ▶ add extra relation between  $\preceq$  and  $R$ .
- ▶ Gödel–Dummett modal logics:
  - ▶  $(P \rightarrow Q) \vee (Q \rightarrow P)$ ,
  - ▶  $\preceq$  is locally linear.

# CANONICAL MODELS IN CLASSICAL MODAL LOGIC

- ▶ Compactness fails for both GL and  $\mu$ -calculus.
- ▶ Therefore the truth lemma fails for them.
- ▶ We can overcome this:
  - ▶ finite canonical models for GL,
  - ▶ final canonical models for  $\mu$ -calculus (for wK4 models).

# CANONICAL MODELS IN INTUITIONISTIC MODAL LOGIC

- ▶ Use theories  $\Gamma$ :
  - ▶  $\Gamma \vdash_L \varphi$  implies  $\varphi \in \Gamma$ ,
  - ▶  $\varphi \vee \psi \in \Gamma$  implies  $\varphi \in \Gamma$  or  $\psi \in \Gamma$ .
- ▶ Works for *completeness*.
- ▶ Usually breaks down for decidability:
  - ▶ CS4 needs a complicated filtration argument,
  - ▶ IS4 needs other methods.

# CANONICAL MODELS IN OUR LOGICS

- ▶ How to prove  $\text{IGL} \not\vdash \varphi$  implies  $\text{IGL} \not\vdash \Box^n \perp \rightarrow \varphi$  for some  $n$ ?
- ▶ Still works if we use an  $\omega$ -rule:

$$\frac{\{\Box^n \perp \rightarrow \varphi\}_{n \in \omega}}{\varphi}.$$

- ▶ Not sure if it could work even over variations of S4:
  - ▶ Does CS4/IS4 have finitely many modalities?

# SEQUENTS

- ▶ In general, intuitionistic proof systems are restricted to sequents of the form:

$$\Gamma \vdash \varphi$$

- ▶ This still works even if we only restrict the following rules:

$$\frac{\Gamma, \varphi \vdash \psi}{\Gamma \vdash \varphi \rightarrow \psi} \text{ and } \frac{\Gamma \vdash \varphi}{\Box \Gamma \vdash \Box \varphi}$$

# NON-INVERTIBLE RULES

- ▶ The rules

$$\frac{\Gamma, \varphi \vdash \psi}{\Gamma \vdash \varphi \rightarrow \psi} \text{ and } \frac{\Gamma \vdash \varphi}{\Box \Gamma \vdash \Box \varphi}$$

are *non-invertible*.

- ▶ We need more care when doing proof search:
  - ▶ we need to choose between different instances of  $\rightarrow$  and  $\Box$ ,
  - ▶ solvable by backtracking or game-theoretic methods.

# LABELLED SEQUENTS

- ▶ Labeled formulas:

$$x : \varphi$$

- ▶ Labeled sequents:

$$\mathbf{R}, \Gamma \vdash \Delta,$$

where  $\mathbf{R}$  is a collection of statements of the form  $xRy$ .

- ▶ We still need backtracking.
- ▶ Not natural for constructive modal logics.

## INVERTIBLE RULES...

$$\vee_l \frac{\mathbf{R}, \Gamma, x : \varphi \vdash \Delta \quad \mathbf{R}, \Gamma, x : \psi \vdash \Delta}{\mathbf{R}, \Gamma, x : \varphi \vee \psi \vdash \Delta}$$

$$\vee_r \frac{\mathbf{R}, \Gamma \vdash \Delta, x : \varphi, x : \psi}{\mathbf{R}, \Gamma \vdash \Delta, x : \varphi \vee \psi}$$

$$\diamond_l \frac{\mathbf{R}, xRy, \Gamma, y : A \vdash \Delta}{\mathbf{R}, \Gamma, x : \diamond A \vdash \Delta} \text{ (} y \text{ fresh)}$$

$$\diamond_r \frac{\mathbf{R}, \Gamma \vdash \Delta, x : \diamond A, \{y : A \mid xRy\}}{\mathbf{R}, \Gamma \vdash \Delta, x : \diamond A}$$

## ... AND NON-INVERTIBLE RULES

$$\rightarrow_{\mathbf{r}} \frac{\mathbf{R}, \Gamma, x : \varphi \vdash x : \psi}{\mathbf{R}, \Gamma \vdash \Delta, x : \varphi \rightarrow \psi}$$

$$\square_{\mathbf{r}} \frac{\mathbf{R}, xRy, \Gamma \vdash y : \varphi}{\mathbf{R}, \Gamma \vdash \Delta, x : \square\varphi} \text{ (} y \text{ fresh)}$$

# FULLY-LABELED SEQUENTS

- ▶ Labeled formulas:

$$x : \varphi$$

- ▶ Labeled sequents:

$$\mathbf{R}, \Gamma \vdash \Delta,$$

where  $\mathbf{R}$  is a collection of statements of the forms

- ▶  $x \preceq y$ ,
- ▶  $x' R y'$ .

## EVERYONE IS INVERTIBLE

$$\rightarrow_{\mathbf{r}} \frac{\mathbf{R}, x \preceq y, \Gamma, y : \varphi \vdash \Delta, y : \psi}{\mathbf{R}, \Gamma \vdash \Delta, x : \varphi \rightarrow \psi} \text{ (} y \text{ fresh)}$$

$$\Box_{\mathbf{r}} \frac{\mathbf{R}, x \preceq y, yRz, \Gamma \vdash \Delta, z : \varphi}{\mathbf{R}, \Gamma \vdash \Delta, x : \Box\varphi} \text{ (} y, z \text{ fresh)}$$

# IGL PROVES $\Box(\Box P \rightarrow P) \rightarrow \Box P$

$$\begin{array}{c}
 \vdots \\
 \text{tr} \frac{xRy, yRz, xRz, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash z : P}{xRy, yRz, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash z : P} \\
 \text{id} \frac{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P, y : P \vdash y : P}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P} \quad \text{tr} \frac{xRy, yRz, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash z : P}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P, y : \Box P} \\
 \rightarrow l \frac{\text{id} \frac{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P, y : P \vdash y : P}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P} \quad \text{tr} \frac{xRy, yRz, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash z : P}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P, y : \Box P}}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P} \\
 \Box l \frac{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P}{xRy, x : \Box(\Box P \rightarrow P) \vdash y : P} \\
 \Box r \frac{xRy, x : \Box(\Box P \rightarrow P) \vdash y : P}{x : \Box(\Box P \rightarrow P) \vdash x : \Box P} \\
 \rightarrow r \frac{x : \Box(\Box P \rightarrow P) \vdash x : \Box P}{\vdash x : \Box(\Box P \rightarrow P) \rightarrow \Box P}
 \end{array}$$

# NON-WELLFOUNDED PROOFS

- ▶ Allow (good) infinite paths in proofs:
  - ▶ for GL, require  $\{x_i\}_{i \in \omega}$  with  $x_i R x_{i+1}$ .
  - ▶ for  $\mu$ -calculus, require  $\{x_i : \mu^{\alpha_i} X.\varphi\}$  with  $\alpha_i > \alpha_{i+1}$ .
- ▶ Good for completeness.
- ▶ Not good for decidability.

# IGL PROVES $\Box(\Box P \rightarrow P) \rightarrow \Box P$

$$\begin{array}{c}
 \text{id} \frac{}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P, y : P \vdash y : P} \\
 \rightarrow 1 \frac{}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P, y : P \vdash y : P} \\
 \text{tr} \frac{xRy, yRz, xRz, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash z : P}{xRy, yRz, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash z : P} \\
 \Box 1 \frac{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P, y : \Box P}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P, y : \Box P} \\
 \Box 1 \frac{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P}{xRy, x : \Box(\Box P \rightarrow P), y : \Box P \rightarrow P \vdash y : P} \\
 \Box r \frac{x : \Box(\Box P \rightarrow P) \vdash x : \Box P}{x : \Box(\Box P \rightarrow P) \vdash x : \Box P} \\
 \rightarrow r \frac{x : \Box(\Box P \rightarrow P) \vdash x : \Box P}{\vdash x : \Box(\Box P \rightarrow P) \rightarrow \Box P}
 \end{array}$$

$x \mapsto = x$  and  $y \mapsto z$ .

# SOUNDNESS

- ▶  $\vdash_L \varphi$  and  $\not\vdash_L \varphi$ .
- ▶ Find a path on the proof of  $\varphi$  which is (stepwise) refuted.
- ▶ The path condition will imply a contradiction.

# COMPLETENESS — NON-WELLFOUNDED SYSTEMS

- ▶ By a proof(model?)-search argument.
- ▶ Keep “saturating” the leaves of the partial proof tree.
- ▶ For example,

$$\rightarrow_r \frac{\mathbf{R}, x \preceq y, \Gamma, y : \varphi \vdash \Delta, x : \varphi \rightarrow \psi, y : \psi}{\mathbf{R}, \Gamma \vdash \Delta, x : \varphi \rightarrow \psi} \text{ (} y \text{ fresh)}$$

where there is no  $z$  such that  $x \preceq z$  is not in the lower sequent and  $z : \varphi$  is not on the right of the lower sequent.

- ▶ If we ensure every such non-saturated formula is saturated, we get either a proof or a counterexample.

# COMPLETENESS — NON-WELLFOUNDED SYSTEMS

- ▶ By a proof-search argument.
- ▶ Keep “saturating” the leaves of the partial proof tree, in two alternating phases:
  - ▶ only rules which do not introduce statements  $x \preceq y$ ,
  - ▶ only rules which introduce statements  $x \preceq y$ .
- ▶ Do some loop-checking to guarantee this search stops:
  - ▶ either a good loop to a lower sequent exists,
  - ▶ or we can simulate a layer in a lower one.

# MAIN RESULTS

Decidability for non-classical variations of

- ▶ GL, and
- ▶ modal  $\mu$ -calculus

using fully-labeled non-wellfounded / cyclic proof systems.

**Open:** Hilbert-style proof systems.
